**Lusardi Creek/4s Ranch: Multispectral Change Detection Techniques
Using
Landsat Thematic Mapper Data
and
Airborne Data Acquisition and Registration (ADAR) Data**

Remote Sensing Research Technical Report

Abstract:

This research investigates two types of multispectral remote sensing platforms: Airborne Data Acquisition and Registration (ADAR) and satellite based Landsat. Several multi-date change detection techniques are used and their application to biological monitoring evaluated. The results indicate that the scale and budget of any remote sensing biological monitoring research must dictate the type of platform used. Landsat appears to be useful for rough scale - broad area analysis of land use / land change, while ADAR is ideally suited for site specific quantitative analysis.
